

Fort Knox!

HiPath 2000 SeCure

The HiPath 2000 SeCure offers a complete all-in-one security solution that includes a protection suite that protects your network against all known threats such as hackers, viruses, spam, phishing, malicious code and trojan horses. In addition to 5 anti-virus engines and 11 layer anti-spam technology, it includes a powerful firewall, an Internet surfing filtering mechanism and mail server. These security applications integrate into the HiPath 2000 platform, which enables modern companies to exploit all the advantages of IP communications for secure voice and data in a single solution. Only one system and network is required for a variety of communications tasks. Whether, Internet access, mobile access, IP telephony or wireless LAN for voice and data – HiPath 2000 is always the right solution.

Secure solutions for the SME and SOHO IP telephony market

The introduction of IP telephony in the market has brought about numerous advantages for organisations. These include low procurement costs as a result of utilising one infrastructure for both voice and data, preinstalled software that makes start-up extremely simple, low maintenance costs, reduced service and administration costs, flexible expansion via user licences and increased mobility of employees within an organisation, as employees are able to utilise extensive telephony functions independent of their location.

However as with any data network there remains the risk of threats to any organisation's internal data. Siemens together with PineApp offers organisations a complete security solution through the use of the integrated HiPath 2000 Firewall and PineApp security applications.

The HiPath 2000 provides a firewall that allows any organisation's internal employees to access the internet but at the same time preventing external access to the organisations internal LAN. The PineApp SeCure SOHO includes key applications such as, Anti-virus, Anti-spam, Firewall with Demilitarized Zone (DMZ), DHCP, VPN server, URL filtering (HTTP and FTP), ADSL and embedded mail-server.

This solution is available in two packages:

HiPath 2000 SeCure Access Pack

- HiPath 2030 System
